Which qualities characteristic for the high-end camera series Imager[®] are, shows already the entry-level model Imager[®] 4300. Equipped with a cooled **focal plane array photon detector with (320 \times 256) IR pixels** this camera enables users to choose between detectors made of different material for thermal analyses in the SWIR and MWIR. Whether **MCT or InSb detector**, both options support **snapshot mode**. **Recording and storing images with frequencies up to 706 Hz** you can analyse even fast processes. In addition, the Imager[®] 4300 comes with an impressive **thermal resolution up to 0.02 K (20 mK)**. In sum this camera series provides a potential that qualifies for usage for a broad range of applications in the fields of industry and science.

The **robust light-metal housing** of the instruments matches this claim. With the combination of the **modular designed camera concept**, the internal trigger interface, most diverse thermographic software and high-quality lenses users benefit from a high level of flexibility allowing to adapt the cameras to almost every measurement and testing task.
